

Site A, Student Interview 1

[0:00:00.0] **Interviewer:** Okay. So I guess I first wanted to start off asking, How did you think your lessons or discussions around data analysis go? What were your experiences like in [Site A Instructor], class?

Nikki: I'd say it's been a slow, growing process. That very first class like I didn't understand even what she was asking of us or talking about. So it took some time. It took several classes. I've taken I guess I'm in my fifth qualitative class now. And so as [0:00:30.0] I have grown, I have understood better what she's asking us to do as far as the analysis. And one of the consistent pieces of feedback that she gives me because apparently I have not learned yet is in my writing, she'll say but why, why? You said what but why? I'm I feel like without using too much jargon, she's trying to let me know if you're going to be doing qualitative research, you've got to dig deeper. Again, it's not surface. This is a different [0:01:00.0] type of research. And so you've got to be really reflecting on yourself, reflecting on your data, trying to find out like what these core ideas are. And so I'm glad she gives me that feedback. I hate. I am embarrassed that that she has to keep giving me the same feedback. I think I've improved on that. But her biggest thing with the, with teaching us about analysis is one, she has us do things like we're doing field work or we're doing some sort of an interview, [0:01:30.0] or we're doing like with each of the classes, she's had us out doing things and then kind of guiding us through. And this is how you analyze this because you know, you would analyze an interview maybe different than you analyze

Interviewer: A focus group

Nikki: Yeah. And so I'm I think it's giving us those multiple experiences. Like I remember that that first-class like she had us just go out on campus and observe people. Right. Whereas when I took the case study class, we were required to [0:02:00.0] do like multiple observations of the same setting and take very detailed field notes. So she was kind of scaffolding for us that those levels of detail so that we could then learn how to. Like we started little and then we [inaudible] in that analysis so that I think that has been valuable because otherwise, you know what if I had stepped into that first class and she went into like the deep theory of everything. It might have turned me off of qualitative research, but instead, because she kinda baby stepped us [0:02:30.0] this with each class, I just got more and more hooked and I'm like, What else can I take? What other class can I do like

Interviewer: So when you went out and you were observing people, was that in [Site A Instructor] class this semester or in a different class with her?

Nikki: That was a different class. Yeah with this so now, I'm in [Advanced Qualitative 3].

Interviewer: Yeah, it's an advanced course, right?

Nikki: It is. And this one really does deal with the theory. We're analyzing Deleuze and [0:03:00.0] Foucault and Butler. And so now we're really looking at kinda the framework of how to do this analysis of qualitative research? We read Denzin's manifesto.

Interviewer: I: Oh wow.

Nikki: So one of the things we're doing is we're each creating our own manifesto, which is kind of like [Site A Instructor] is one of those that says, you know, people will ask, What can I do this? Can I do that? Our answer is always, if it makes sense, you can do it. If you have a way to justify [0:03:30.0] your idea on how to analyze this data, then yes, of course you can

do it, but you have to have a reason. You can't just willy nilly just start doing stuff, right? So each of us have had this opportunity to design our own manifesto. And then we, we, you know, we talked in class, we all kind of say, well this is my idea. We did it kinda in small group and then we did it in large group. And everybody's is different. Some people are doing like an art-based [0:04:00.0] manifesto and some people are doing a Video Project. And, and so she's allowing us that opportunity to individualize, you know, how we want to put together what we know about qualitative research. And then of course, there's the accompanying paper that then where we discuss that. Why, why did you pick this?

Interviewer: Yeah, What is your manifesto about?

Nikki: Okay, So I decided to focus on this whole idea she and I we were counseling about something. And the comment she made was, think about [introductory qualitative course], [SUBJECT], you have [0:04:30.0] grown so much. And that's stuck with me, right? And I was like, I really, I have, I've learned a lot. And so I was like, what have I learned? Let me make a list. I just started making a list of these are the things I have learned. And then I thought, you know, I realize that we have glossaries of qualitative research and we have encyclopedias of but what about mine? What would mine look like? And so I wound up after jotting down a list of all the words [0:05:00.0] I could think of that had any use in qualitative research. I had like a 100 terms. Yeah. And I'm like, Okay, what do I do with these? So then I started, I'm like, What do I know about each one? And I started typing. What do I know about each one? I was like, You know what? I went to this conference and the guy said without data, it's an opinion. And it was like, okay, all right, so now we need some data. I'm going to go through [0:05:30.0] all of the art we've read. Can I tell you that in five classes, I have probably read 500 articles just for my qualitative courses that didn't count my other classes. Like a lot of reading. And I'm like I and I've saved them all. So I'm like, wow, I've got this rich treasure trove of data. I've gone through and found like a quote from, you know, for each of my terms, from one of the articles or one of the textbooks that we've had [0:06:00.0] class. And I'll tell you what that's done for me because I'm about to do my field experience for qualitative for the qualitative certificate, it's helped me revisit things that maybe I would have like left on the shelf. So now I'm really exploring all these ideas that I've learned throughout my qualitative education. So to me that that's what makes it a manifesto, right? Because like now I'm deeply invested in everything I've ever learned about qualitative, right? And now I feel like, Okay, [0:06:30.0] you've got, you know, where your data is. And it reminded me like I've made notes in the margins of the articles in the books and I'm like, Oh yeah, that was so important. I'm so glad I found that again. Would I have found that if it hadn't been for this project. So now when I'm doing my field experience next semester, I can I'll know Oh yeah. I've got this stack of stuff and it is waiting for me, ready to go.

Interviewer: Wow, [0:07:00.0] what an incredible resource you're building for yourself for the future.

Nikki: Yeah, I'm really excited about that. Like I feel like, okay, you've got you've actually done something now, and I probably put more hours into that project than say writing proposal for my mixed methods class. And it's like, Okay, I'll get to that, I'll get to that. But this, the qualitative manifesto, this I'm interested in. So I've been putting all these hours in.

Interviewer: And it feels like, it feels like [0:07:30.0] something you can use, which is always helpful.

[NIKKI]: And of course as [Site A Instructor] says, we are all nerds, so the nerd in me now has created this document and I've hypertext everything. So you know if I mentioned the word

classism here, but I've got the definition of classism over here, I've got a hyperlink, so it goes- So I'm kind of excited about that.

Interviewer: Yea! You should sell this resource. You could start a business.

[NIKKI]: Right!? I don't think people can afford me. ((laughter))

Interviewer: Moving [0:08:00.0] on here. How do you think the lessons went around pedagogy of refusal went, when [Site A Instructor] was talking about pedagogy of refusal related to data analysis, can you tell me a little bit about how those discussions went for you?

Nikki: So she had assigned us some readings about refusal, and that was one of the weeks where she also had us do like an annotation. So we had to pick like one of the articles and then write a reflection about that. Um first time I'd ever heard of refusal. Like honestly, [0:08:30.0] that was a novel concept and that was this semester in my fifth course. And I was like, okay, but it actually means more than one thing, like this author is talking about their refusal to be a participant, to be mined for data, right? That they are not going to share their story because they are not going to add into this whole thing we have going on like research. But this other article we had about refusal, they were refusing to be quiet. They were refusing to, you know, to be subjected [0:09:00.0] to the discrimination against qualitative research. This, that author was saying, no I'm going to keep pursuing qualitative, and I'm going to keep saying that this is real research, and this is why. And so I thought, what an interesting idea that, you know, we, we take this- it's like Deleuze does this, right? He takes his word and then he reinvents it, right? Reapplies it in different ways. And I felt like refusal was kind of the same way because it can mean more than one thing, because the one [0:09:30.0] is saying I refuse to speak, and the other one saying I refuse to shut up.

Interviewer: Yeah. So when you hear pedagogy of refusal, what does that mean to you? Like, how do you understand it?

Nikki: I would, So pedagogy then is going to be the way that you teach something, right? And so I would take pedagogy of refusal to mean how how we investigate this idea of the concept of refusal? What is refusal? How does it look, how does it apply?

Interviewer: Can you tell me a little bit [0:10:00.0] about how it applies specifically to the data analysis part of qualitative research? Or is it more so about like whose data and for what purposes?

Nikki: Oh, yeah. Yes, exactly. You just put into words what I was trying to think of because because as you know, as you're analyzing data, as you're considering those, those why's and, and You know, and even if you're trying to even code your data, right, you're trying to make some decisions. I would think with refusal then you're considering, but [0:10:30.0] what are the parts that need to be unsaid, right? What are, what are the things that should be those silences, those desiring silences. So that- well I mean, there could be so many reasons though, right? Like maybe one of them you're worried about confidentiality or maybe something sensitive, or maybe it's that by leaving it unsaid, that leaves room for a different kind of analysis or a different kind of interaction with that data. So I would think that the idea of the refusal and doing your data analysis is [0:11:00.0] that, it's another one of those decisions. Were constantly as qualitative researchers during the entire process, we're having to make these decisions. And they're decisions about you know, how are we going to manage it, or what product do we want to end up with in the end, how are we going to treat our participants, and how are we going to respect whatever that field? And so to me it seems like refusal just

kinda fits in with that whole idea of that's one of those decisions that has [0:11:30.0] to be made along the way.

Interviewer: Mhm. Great. What about coding? How did coding go and how did you understand coding qualitatively in this class?

Nikki: I feel like coding is as nebulous as anything else in qualitative research. It's like, well, if it makes sense, like, Hey [Site A Instructor] Can we do this? Well, it depends. She always says that, it depends. And that it you know has to make sense. So with coding, it's like, there's no one way to do it. There are all the ways that you [0:12:00.0] could do it. And, you know, a person might have a preference. So for me, when I read articles, what I do is I maintain this master spreadsheet, my matrix, my literature matrix, where I keep up with things like major themes. I color code my spreadsheet because I'm a nerd. And so for me that is a type of coding where I've got everything managed. I know where it is. I have, I already have it laid out on like what are the main ideas, what are the main themes? Whereas [0:12:30.0] somebody else, maybe they're, I don't know, maybe they've printed all their stuff and are now highlighting it, or maybe they're using. What is that software? Is it [QUALITATIVE SOFTWARE]? Is that what I'm thinking of?

Interviewer: Yeah.

Nikki: And so it depends on the person, right. And so even though I've got my spreadsheet and to me that works, there's going to be a project where that's not what works, right? And I get that opportunity to shift and code differently, right? And what- one of [0:13:00.0] the articles was basically saying that even trying to code your qualitative data is not qualitative. Like you're, you're, you're not engaging with the data in the way that qualitative data should be engaged. So I thought that was a little harsh, right. Because it depends on the project and it depends on the data as to whether or not coding is going to be appropriate, and which type of coding would be appropriate. And that's the beauty is that we get, we get to choose, right? There's not one [0:13:30.0] way to, it's like if you're in quantitative class and you're using that SPSS and you're trying to get a, i don't know, multivariate whatever, blah, blah, blah. And there's only one way to put it in the machine to get the one answer back out. And trust me, if you put it in wrong - because I did this - you get nothing. Like it comes up with like error messages and stuff. But in qualitative, we never get error messages. We can make mistakes, right? And [0:14:00.0] we can have some regret. We can choose to change or fix some things, but everything is, it's like everything is a fair game as long as it makes sense. And as long as it's respectful and sensitive and you're considering more than just yourself and your project that you're trying to come up with your research.

Interviewer: When you think about some, thinking back to some of the lessons this semester when [Site A Instructor] was coding and teaching about coding, can you can you recall how she taught or talked [0:14:30.0] about coding?

Nikki: I remember um in a previous class, the interview class. That was when she first introduced us to this idea that there is software, but it's not like it's gonna do it for you. It's really just a place to hold your ideas that you input. But never required us to use that. But she even brought up again in this class. You are welcome to code in any way that you want to code, what works for you, as long as it makes sense. She always says [0:15:00.0] that, as long as it makes sense. So she's never, she's never really guided us like step-by-step, like this is how you code because that kind of goes again, that would be anti [Site A Instructor]. Really her whole premise is, well, here are several ideas and you can choose from those, or you can do it do it this other kind of way that you have made up or that you like, depending on who

you are, what you're studying. It's all about the study and what you're trying to [0:15:30.0] get from it.

Interviewer: Amazing. What did you find helpful in the lessons and discussions around analyzing your data?

Nikki: I find it helpful when we're able to come back to the data more than once. Like sometimes she'll have us get in small groups and discuss with each other like this, we did a thing, an exercise, where we brought a data from a previous class. And we were to look at it in a, use a different lens. So like I brought an interview I did in my first qualitative [0:16:00.0] one, class where my research interests back then was teacher leadership. And so I transcribed this interview. And when I had written about it, I was all focused on the leadership part, right? So when I brought the same dataset to this class, to the [Advanced Qualitative 3] class. My purpose when I was meeting with my small group about it, was to consider my positionality when I need that interview. Because I had interviewed like the guy who would replaced me at my last job. And so I didn't consider it, like I [0:16:30.0] picked him because to me it was like, Oh yeah, I'll know what he's talking about. But then when we were revisiting the - we were re-analyzing that data I realized, Oh wait, there's so much more here like How, how did that affect, you know, the fact that I picked the guy on purpose because he took my job. What does that mean? Right, and if I look at this whole dataset with this other lens. So then after we had discussed all that with small group. We came back [0:17:00.0] another week with a different group and did something similar, like we were to extend that conversation. And so then I was like trying to defend to my classmates why I thought that other lens would be appropriate for this dataset. And so then, we got a chance to kind of bounce these ideas off of each other. And then you know some people in the group were like, Oh, thank you for that feedback. I hadn't considered it that way, now I think I'm going to look at it in this [0:17:30.0] way. And so we actually were informing each other with, with our various ideas and our feedback. And so instead of [Site A Instructor] being the one to like, you know, we didn't turn in papers that she graded and gave us feedback. She gave us an opportunity to kind of do that for each other. Which, she's been talking about someday, you know most of us in that one class are going for the qualitative certificates, she's like someday you may have a job where you are teaching these classes. So you [0:18:00.0] need to be thinking about like, how would you teach this? And I'm thinking, I should have recorded every lesson she ever did because she always says it so good and can I ever do it as good as she does? And so then all of a sudden I had all this doubt like, oh my goodness, can I teach this? Can I really explain like how to analyze this data and why? And that that was a, that was a kind of one of those moments where you shut down because you freak [0:18:30.0] out and you're like, I can never do that. I can never be that good. But you know, as you go, you realize, okay, okay alright. I, I could probably do that.

Interviewer: This actually kind of brings us nicely to our next question, which really is about the small group exercises. So we noticed that in one of your lessons, your instructor had you work in small groups to analyze your data. And some of the questions that were posed was, considering the data selected today, why did you select your data? [0:19:00.0] Why were you willing to share your data? What were some of the concerns that you had about sharing this data? Can you tell me a little bit about how that exercise was for you?

Nikki: Yeah. It was, it it was one of those times where you're like, oh, I never thought of that. Why do I do that? And so you really have to stop and be reflective right then. Which is useful, I think, because sometimes we get in our own heads, you know, we kind of have this project. [0:19:30.0] We worked on it. We already have it in our head how it's all going to work out. But we're cutting it short, right? So by having that exercise where we had to justify right, we

had to really rethink that, reconsider it, and come up with with justifications. And that I think elicited that shifts like, Oh, I really could look at that data this way. And so I think it takes us beyond where we would - just working on it yourself - I think we get stuck like in [0:20:00.0] our own little habits. But by talking about it in our small group, now we're having, we're getting input from our other classmates who think differently than we do. Go figure! And so sometimes it's relevatory like, Oh my goodness, I'm so glad you said that, I would not have thought of that. Thank you. And I had moments like that, so and also sometimes we go in with some insecurity, right? So sometimes that feedback is oh you are on the right track. This is a good idea, right? [0:20:30.0] Because I feel like from our instructors maybe we don't always get that. Our instructors, they're trying to help us grow. So they're going to have criticism, like you should look at this way. Well, you really should do this. Well why- Trying to help us grow in that way. But by doing it as group work. Because sometimes we do it like in pairs, sometimes we do it like in groups of four. We would, she switches it up all the time and none of the ways work particularly better [0:21:00.0] than another. But I think having all the different setups, like sometimes we will get on to a Jamboard discussion board together. Sometimes we will just talk face-to-face. Sometimes we will cprovide written feedback to each other. She changes it up, which- and all of those ways had been, had been good ways. But I think that if it was just confidence building, right, to have your classmate go, yeah, I see what you're talking about. Because I think sometimes we worry like oh this is so stupid, why did I write this? [0:21:30.0] This doesn't make any sense. But then if they, if they understand it, you're like, oh, maybe I was on target.

Interviewer: Mm-hm. Mm-hm. Yeah, it's kinda nice to get that affirmation sometimes, and yeah. What did you find it confusing or unclear in the lessons around data analysis, if anything at all?

Nikki: I've had many moments where I have been confused. ((laughter))

Interviewer: ((laughter)) me too, what a question to ask a qualitative scholar.

Nikki: I do remember in the case study, I hope I'm not going [0:22:00.0] to outside of the, i'm talking about other classes.

Interviewer: That's okay.

Nikki: So in case study class, she never came out and told us, this is a case study step 1, 2, 3, 4. She allowed us in the course of several weeks to discover what a case study was, which there was a lot of angst in that room. This one man cried. So, because you know we're all so accustomed, we've been conditioned that if we sit in our little desk, the teacher's going to tell [0:22:30.0] us all the answers, and we're going to learn, we're really smart people, so we learn it fast, and this is great. But she did it a totally different way. She wanted us to really analyze what is a case study and then apply what is a case study. So she gave us this, so even without actually telling- Now, mind you, we had a book, we'd already been reading articles. We're supposed to be. I assume the the plan was that we were slowly picking up on it as [0:23:00.0] we go and forming our own understanding, doing our own analysis of that case study. But she gave us like The Three Little Pigs, and we were supposed to go through the story of The Three Little Pigs and, and identify the elements of case study within that children's story. And it was it was fun, it was creative, it was different. And that's why I said, the guy cry. Like he said, he was like this did not fit his model of qualitative education. And he left with a stomach ache, like, [0:23:30.0] Oh poor guy, like, it really was supposed to be just fun and he took it too seriously, I think. But because of that, I know what a case study is, right. Before the class. I was like, oh yeah, I've heard a case study like that that's when you look at one thing and you-

. No. there 's so- it's you can't just throw around the word case study willy nilly, right? There are actual parameters and rules for that. And so now I feel like I really [0:24:00.0] understand that. So we got to this class where we're talking about like theory, right? And we're looking at all these French phil - I don't know why all the philosophers are French. And I don't speak French, so I struggled with pronouncing their names. But but we're really looking into, you know, not only what they say, but also what other people are saying about them. And that has caused me to like, take on that responsibility. Oh, she's not going to tell me what this philosopher [0:24:30.0] says and what they mean. I am discovering what that philosopher says and what it means, and what it means to me. And so I had to take ownership of like, I had to quit thinking, Oh, I'm going to sit in the chair and she's gonna tell me everything. Heck, no. I had to do that reading and I had to piece it together and figure it out. And then we were doing like class presentations. So each little small group is presenting each different philosopher, right? So now I'm [0:25:00.0] also learning from my classmates, and i'm hearing what their analysis is. And I'm getting to chose to either add that to my understanding or skip on it because I'm on, you know, not everybody gets everything the same way you do. But I'm not feeling this pressure of I'm going to write it all down. Everything that's said, I've got to get that. It's, no, I can take from this what I need to get from this. And so it gives me kinda that cafeteria [0:25:30.0] plan where I'm able to kind of pick and choose my understanding about, about these philosophers.

Interviewer: Wow, Great, That's super helpful. So another question we had, what suggestions might you have for an instructor who might teach qualitative data analysis in the future?

Nikki: Okay. You know, as, as I've considered, what, how would I be an instructor? How would I do this? What I do?

Interviewer: It's so interesting, right?

Nikki: I've started trying to form my own philosophy about that. And there are so many things [0:26:00.0] that my instructors have done that had been successful for me. But that doesn't mean they will be successful for everybody. So I think like that one, that one case study class where people were all stressed out. Maybe there could have been a point at which, there could have been like a little more of an outlined, presented, along with, I mean, okay, I'm a science teacher. So in science education we struggle with, well do I give them the content first or do I let them do the experiment first [0:26:30.0] and kind of let them struggle. And as a science teacher, I would go back and forth just because one I felt the variety was good for my students. So sometimes I would give them a little bit of data and then I would give them an exploration to do sometimes cold turkey. Here, here's some equipment. Here's the question. Figure out how you're going to find the answer to that question. And of course my students hated that because it put you in this vulnerable, vulnerable position like, but I [0:27:00.0] don't know if I'm going to do it right. And so I feel like it's kinda the same with the qualitative research and teaching students how to do qualitative and how to do the analysis. There is room for a little bit of each, right? There's room for a- go ahead and give some of those facts or some of those outlines, but also give the students this opportunity to struggle, right? Because that's when we learn best. You gotta rewrite those pathways if you're going to actually [0:27:30.0] learn it. And that only happens if there's stress, right? So I think there's, there's something in taking what I know as a science teacher and then applying it to be a qualitative instructor. And that's allow the students to do some exploration, but also have room in there for also like verify a little bit of what they're learning, right? Because like I said, the beauty of qualitative is that we each get to kinda take we want from it. But I think sometimes it's good to [0:28:00.0] just make sure that everybody is even on one of the tracks, right. You don't want somebody walking through the grass way over there and they don't even

understand qualitative at all. So I feel like there is plenty plenty of room for all of the legs, right? For the group work, the direct instruction, the self-discovery. And just kind of doing a sampling of all the methods and methodologies.

Interviewer: If you were going to describe, and this is kind of going back to pedagogy of refusal, so if you were [0:28:30.0] going to describe to someone unfamiliar with using pedagogy of refusal as an analytic strategy or technique, what would you say to them?

Nikki: So that's a good question. I think I would tell them. I don't know what I want to, I don't know that I would want to tell them anything. I think it's one of the things where they they would have to read about it, right? And form, and start to get some of their own ideas and then have more of a dialogue instead of maybe [0:29:00.0] a direct you know, here's the answer about pedagogy of refusal. Because I don't know. I just, I felt like maybe because I learned is through discovery that I think that's the way everybody should learn it, is through discovery. You know like read those articles, form some opinions, have a group discussion about it. Because that was not a topic I felt that we were given that that direct instruction. So I don't have a model for what that would look like.

Interviewer: Yeah, and it's so interesting, [0:29:30.0] you use the language discussion, and actually in our prep for this interview today, our interview protocol, lesson plan. Lesson plan. You know, how did the lesson plan go? And we noticed, oh, well, it seems more like a discussion. This class seems more discussion-based than, lesson or lecture based?

Nikki: Definitely.

Interviewer: Yeah.

Nikki: And that's been a progression, you know, qualitative one was very lecture oriented, like she had a PowerPoint for every class. There was actual content within those PowerPoints, in addition to all the other things. But now that [0:30:00.0] we've progressed up to [Advanced Qualitative 3], I mean, her PowerPoint really just has like logistic information. Like here is this workshop coming up and here's when things are due. And now all of what we're learning is primarily through, and sometimes the discussion is with her. So for example, the students are doing these presentations on these theorists and they are presenting, they were asking us questions we're dialoguing and that every now and then she will come in and just kind of add to, like but you know what, [0:30:30.0] I want to add this to what you're saying. And so it's not her saying, Well, you're wrong. But it's really more of this idea of you guys have said a lot of great things, now let me tell you what my knowledge base is which she doesn't have to tell us it's so much greater than ours. We already know that. And just she's this particular instructor is so grounded like she's so what's the word I'm looking for? Like, everything makes sense, [0:31:00.0] right? It's articulated just so clearly and conscientiously that when she adds to it, it's very thought-provoking. It's it's it's not like oh, why did she say that? It's always like yes. Okay. I get that. That's awesome.

Interviewer: Huh. So this actually brings us to our last question, which is my favorite question always to ask. Is there anything else you'd like to share with me about data analysis?

Nikki: I love that question. I always use it. That last question. And people are like, [0:31:30.0] Oh, I didn't know you're going to ask, you know, and sometimes they're like, Oh, well, I thought you were going to say this and then they go off. So okay, what would I say about the data analysis?

Interviewer: Yeah, from a student's perspective, like what really has helped and not helped and any other things that you want to throw out, or questions that you thought I was going to ask and then I didn't ask.

Nikki: Yeah. I think that learning how to analyze data is [0:32:00.0] a progression. I don't think that anyone could just sit down and in one class be told, this is how you analyze data like we had to practice it. We had to cry it out. Well, here's how I want to analyze this and then get that feedback. Either got feedback from the instructor, feedback from our peers, and then make adjustments, make little shifts and direction as we went. And so that my understanding of the data analysis is so scaffolded. Now, my, I guess what I wonder is, was that [0:32:30.0] the grand design, was that the big intention, or is that just what worked for me. So I don't know the answer to that part. So I I guess I would think that you, some questions to be asked would be like, well, how were you taught how to analyze data? To which I would say, well, there's no way to say it like it happens so gradually. And it happened not in one instance, but over many instances, right. And I hadn't had, if I hadn't been asked to [0:33:00.0] to do the analysis and then be guided afterward, you know. Then I think I would not have the same understanding that I have now like I actually sometimes you have to do it and fail, right? To really do, really get it. And then sometimes you have to do it and then get little pat on the back and I'm like, oh, yay, I got that. Okay. And I think both of those really have added to this feeling that I have that it just slowly just kind of accumulated and built [0:33:30.0] over time. You know, I I guess I would Yeah I guess I would have expected a more direct, like how did your instructor teach you how to analyze data? I don't know to which I would say the same thing I've already just said. Like, it's not something you need to sit down and tell a person. I mean, look at how many books there are on how to analyze data, I have a stack of them next to my computer now that I'm using to go through to build [0:34:00.0] my manifesto. So I can assure you there are several books on how to analyze data. And they all say it differently, right? And I don't think that any one person could pick up any one book and then go, okay, I got it. I'm ready to go. Then. It just it's so it's so much more complex than that.

Interviewer: And sounds like. It seems like a very individualized kind of process.

Nikki: Exactly.

Interviewer: Well, I think I have no other questions for you at this point. Do [0:34:30.0] you have anything else you might add to this conversation? Any questions or concerns?

Nikki: I don't have anything at this point.

Interviewer: Before I let you go, do you have a pseudonym that you might like us to refer to you by if we do use any of your quotes and publication?

Nikki: My pseudonym choice would be Nikki.

Interviewer: Nikki with N-I-K-K-I or? You chose a good pseudonym. Okay, cool. I will follow up with you. Thank you so much. This was a super generative conversation and a really great [0:35:00.0] way to start off my week.

Nikki: I hope your project goes well.

Interviewer: Yeah, I think that it will, I yeah, I think it's like a pilot and it's probably going to extend which it try to write it because there's not a lot of research on this topic. So, well, maybe we'll see each other at a conference.

Nikki: I love that.

Interviewer: Me too. Buh-bye.

Nikki: Bye, [INTERVIEWER].
